

When you document your steps to solving a problem, you'll need to use mathematical symbols that are not available on the keyboard of your computer. Some symbols like powers and subscripts and powers can be formed by formatting regular text. However many mathematical symbols can only be created using specialized software designed to work with Word and other word processing software.

In this class, you'll need to utilize a software package called Mathtype to create matrices. You can download the software for free via the link in the Orientation folder. If you are working on a campus computer, the software has already been downloaded and installed. This software is the standard software used to create documents containing mathematical symbols.

In this technology assignment, you create a system of equations whose solution corresponds to the number of letters in your name. Once you have created the system you'll solve the system with the help of your calculator and then use Mathtype or the equation editor in Word 2007 or 2010 to document each step. The version of Mathtype that is available of free works best with Word 2003 or 2007. If you are using Word 2007 you may use Mathtype or the equation editor in Word 2007. If you are using Word 2010, you'll want to use its built in equation editor.

Your system of equations should have a solution in which the x-value is equal to the number of letters in your first name and the y-value is equal to the number of letters in your last name. For instance, the solution $(x, y) = (2, 1)$ would correspond to a person whose first name has 2 letters and last name has 1 letter.

There are many systems that could have this solution. For instance, the system

$$\begin{aligned}x + y &= 3 \\2x - 3y &= 1\end{aligned}$$

has the solution $(x, y) = (2, 1)$. To check, simply substitute $x = 2$ and $y = 1$ into each equation:

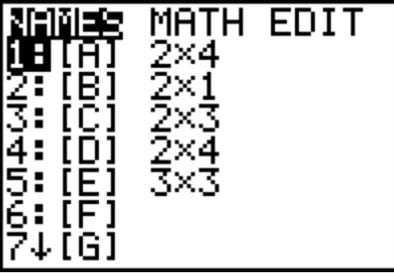

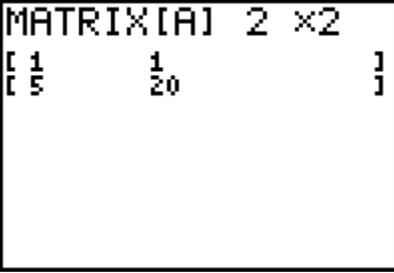

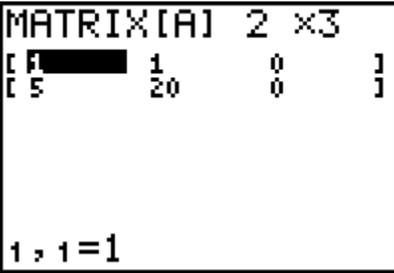

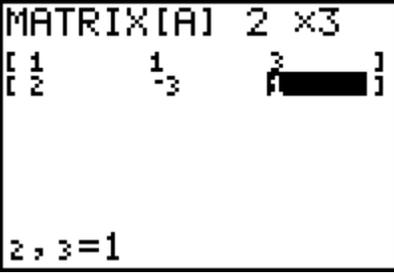

$$\begin{aligned}2 + 1 &= 3 \\2(2) - 3(1) &= 1\end{aligned}$$

Since both equations are true, $(x, y) = (2, 1)$ is a solution to the system. You'll need to come up with a system of equations that corresponds to the number of letters in your name.

Once you have your system, follow the steps below with your system to perform Gauss-Jordan elimination on your calculator. Then use the information about Mathtype or the equation editor in Word 2007 or 2010 to document the steps you followed. On the last page are the final instructions for this assignment.

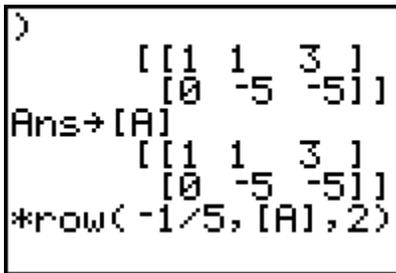

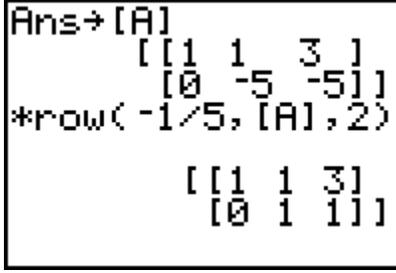

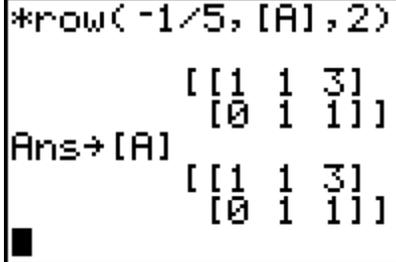

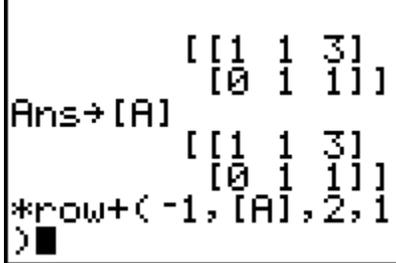

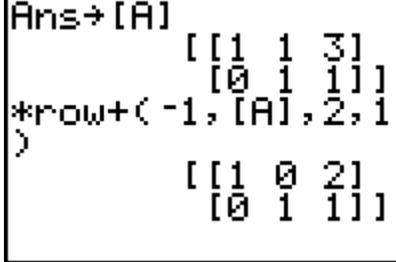

Carry Out the Row Operations on a TI-84

The description below describes how to carry out row operations to solve the system of equations above. You can also do these steps on paper without the use of a calculator.

<p>1. To solve the system using row operations, we first need to put the system of equations into an augmented matrix. For the system above, the augmented matrix is</p> $\left[\begin{array}{cc c} 1 & 1 & 3 \\ 2 & -3 & 1 \end{array} \right].$ <p>2. Turn your calculator on and press CLEAR to erase anything on the Home Screen.</p> <p>3. Press 2ndx⁻¹ to enter the MATRIX menu. This menu allows you to refer to a matrix's name, do math with matrices, or edit a matrix.</p>	
<p>4. We'll start by entering the matrix into the calculator. Use the ▶ button to highlight EDIT. The EDIT menu allows you to enter matrices of any size into matrices with names [A], [B], ect.</p> <p>5. Press ENTER to edit the matrix called [A].</p> <p>6. The screen shown to the right should look similar to yours. It indicates that matrix [A] is currently a 2 x 2 matrix (yours may be different). It also shows the contents of the matrix below the dimensions.</p>	
<p>7. Since the matrix we are entering is a 2 x 3 matrix, change the dimensions by pressing 2 ENTER 3 ENTER. Notice that the matrix below grows to the proper number of rows and columns as you enter the dimensions. If you have more than 3 columns in a matrix, the contents of some of the columns will be off the right side of the screen and can be accessed using the ◀, ▶, ▲, ▼ buttons.</p>	
<p>8. Enter each of the entries in the augmented matrix followed by ENTER. Make sure you have written down this matrix.</p>	

<p>9. Now that we have entered the matrix into the calculator, return to the home screen by pressing $\text{2nd} \text{MODE}$.</p> <p>10. Press $\text{2nd} \text{x}^{-1}$ to enter the MATRIX menu again.</p> <p>11. Press ▶ to move to the MATH menu in MATRIX.</p>	
<p>12. This menu contains all of the commands we'll use to do row operations with your calculator. Use the ▼ to scroll down to the window shown to the right.</p>	
<p>13. The first command we'll use is $\text{*row+}()$. Scroll down to F: $\text{*row+}()$ using the ▼ button and press ENTER.</p>	
<p>14. The syntax for this command is that it requires 4 inputs. First is a number indicating what we'll multiply the row by. Second is the name of the matrix. Third is the row we'll multiply and last is the row we'll add to. In the case of our matrix, we'll type $\text{*row+}(-2, [A], 1, 2)$ indicating that we'll multiply row 1 in the matrix [A] by -2, and add that to row 2. The result will be placed in the second row. This should put a 0 in the second row, first column. To start this command, press $\text{(-)} \text{2} \text{,}$.</p>	
<p>15. Next we need to enter the name of the matrix, [A]. Press $\text{2nd} \text{x}^{-1}$ to enter the MATRIX menu.</p> <p>16. Since NAMES is highlighted and 1: [A], we can press ENTER to paste [A] to the $\text{*row+}()$ command. If you had stored your matrix under a different name, you would scroll down to the appropriate name and press ENTER.</p> <p>17. Press ,.</p>	

<p>18. The next two inputs indicate the row we'll multiply and which row we'll add to. Press $\boxed{1}\boxed{,}\boxed{2}\boxed{)}$.</p>	<pre>*row+(-2, [A], 1, 2)</pre>
<p>19. Press $\boxed{\text{ENTER}}$ to see the result of the row operation. Notice that the entry in the second row, first column is 0 as desired.</p>	<pre>*row+(-2, [A], 1, 2) [[1 1 3] [0 -5 -5]]</pre>
<p>20. We have completed the row operation, but now we need to save this new matrix as [A]. Press $\boxed{\text{STO}}\boxed{\blacktriangleright}$. This will take the answer we just found, and store it in some location.</p>	<pre>*row+(-2, [A], 1, 2) [[1 1 3] [0 -5 -5]] Ans→</pre>
<p>21. To specify the location, press $\boxed{2\text{nd}}\boxed{x^{-1}}\boxed{\text{ENTER}}$. This will store the new matrix in [A].</p>	<pre>*row+(-2, [A], 1, 2) [[1 1 3] [0 -5 -5]] Ans→[A]■</pre>
<p>22. Press $\boxed{\text{ENTER}}$. Write down this matrix so that you can include it in the steps you'll document using Mathtype.</p>	<pre>*row+(-2, [A], 1, 2) [[1 1 3] [0 -5 -5]] Ans→[A] [[1 1 3] [0 -5 -5]]</pre>

<p>23. Note that we have a 1 in the first row, first column and a 0 in the second row, first column. Now we'll change the -5 in the second row, second column to a 1. To do this we'll multiply the second row by $-1/5$ using the *row(command. The syntax for this is *row($-1/5$, [A], 2). The first input is the number you'll multiply by. The second input is the name of the matrix. The last input is the row you'll multiply. The result will be placed in the row you'll multiply. Enter the command so that it appears like the screen on the right. You'll need to press $\boxed{2\text{nd}}\boxed{[x^{-1}]}\boxed{\blacktriangleright}$ first to get to the MATRIX MATH menu.</p>	 <pre>) [[1 1 3] [0 -5 -5]] Ans→[A] [[1 1 3] [0 -5 -5]] *row(-1/5, [A], 2) </pre>
<p>24. Press $\boxed{\text{ENTER}}$ to carry out the command. Notice that a 1 is now in the proper place in the matrix.</p>	 <pre> Ans→[A] [[1 1 3] [0 -5 -5]] *row(-1/5, [A], 2) [[1 1 3] [0 1 1]] </pre>
<p>25. Store the matrix in [A] by pressing $\boxed{\text{STO}}\boxed{\blacktriangleright}\boxed{2\text{nd}}\boxed{[x^{-1}]}\boxed{\text{ENTER}}\boxed{\text{ENTER}}$. Write down this matrix so you can document this step later.</p>	 <pre> *row(-1/5, [A], 2) [[1 1 3] [0 1 1]] Ans→[A] [[1 1 3] [0 1 1]] █ </pre>
<p>26. In the last row operation, we need to place a 0 in the first row, second column. We'll do this by multiplying the second row by -1 and add the result to the first row. Carry out this operation by reproducing the screen to the right (look at steps 12 through 19).</p>	 <pre> [[1 1 3] [0 1 1]] Ans→[A] [[1 1 3] [0 1 1]] *row+(-1, [A], 2, 1))█ </pre>
<p>27. Press $\boxed{\text{ENTER}}$ to carry out the row operation. Notice that a 0 is in the proper position. Write down this matrix. It indicates that x is equal to 2 and y is equal to 1. It matches the solution we were anticipating so we have completed the Gauss-Jordan process successfully.</p>	 <pre> Ans→[A] [[1 1 3] [0 1 1]] *row+(-1, [A], 2, 1)) [[1 0 2] [0 1 1]] </pre>

In some instances you may want to interchange two rows of a matrix. You can do this from the MATRIX MATH menu using the rowSwap(command. Its syntax is

`rowSwap(name of matrix, first row to interchange, second row to interchange)`

Typing `rowSwap([A],1,2)` will interchange the first and second rows in matrix [A].

Always remember to store your matrix using the  button as you work through the process. Forgetting to do this is the most common mistake students make.

Document Your Steps in Word Using Mathtype in Word 2003 or 2007

Now that we carried out the row operations on a graphing calculator, we'll document those steps using Word 2003 or 2007 and Mathtype. You can also use the built in equation editor in Word 2007 or 2010 to carry out these steps. The instructions for using the equation editor in Word 2003 or 2010 are shown on later pages of this document.

We want to explain the steps like what we see below:

Step 1: Write down the system of equations.

$$\begin{aligned}x + y &= 3 \\ 2x - 3y &= 1\end{aligned}$$

Step 2: Write down the corresponding system of equations.

$$\left[\begin{array}{cc|c} 1 & 1 & 3 \\ 2 & -3 & 1 \end{array} \right]$$

Step 3: Multiply the first row by -2, add it to the second row and place the result in the second row or $(-2 R1 + R2 > R2)$.

$$\left[\begin{array}{cc|c} 1 & 1 & 3 \\ 0 & -5 & -5 \end{array} \right]$$

Step 4: Multiply the second row by $-1/5$ and place the result in the second row $(-1/5 R2 > R2)$.

$$\left[\begin{array}{cc|c} 1 & 1 & 3 \\ 0 & 1 & 1 \end{array} \right]$$

Step 5: Multiply the second row by -1, add the result to the first row and place the sum in the first row $(-1R2 + R1 > R1)$.

$$\left[\begin{array}{cc|c} 1 & 0 & 2 \\ 0 & 1 & 1 \end{array} \right]$$

Step 6: Read the solution from the augmented matrix, $x = 2$ and $y = 1$.

In the steps below, you'll learn how to enter a system of equations (as in step 1), an augmented matrix (as in steps 2 through 5) and an equation on a line (as in step 6) into Word.

Create a System of Equations in MathType

1. Start Word 2003 or 2007.
1. Along the top of Word 2007 you'll see a series of tabs. If MathType has been successfully installed, you'll see a MathType tab. Left click on the MathType tab. In Word 2003 you'll see a menu item called MathType. Click on the tab or menu item.

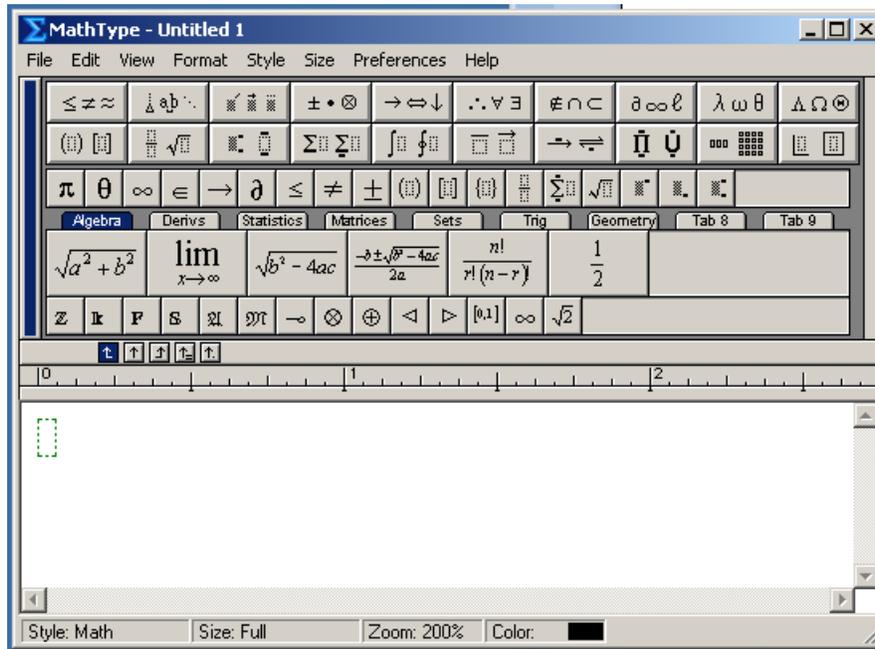

This panel contains all of the commands to start MathType or insert basic symbols. On the right side is the Insert Equations part of the panel. You can insert an equation within a sentence by left clicking on Inline. You can insert an equation on a line by itself by left clicking Display. You can even insert

equations labeled with numbers on the right by left clicking on Right-numbered.

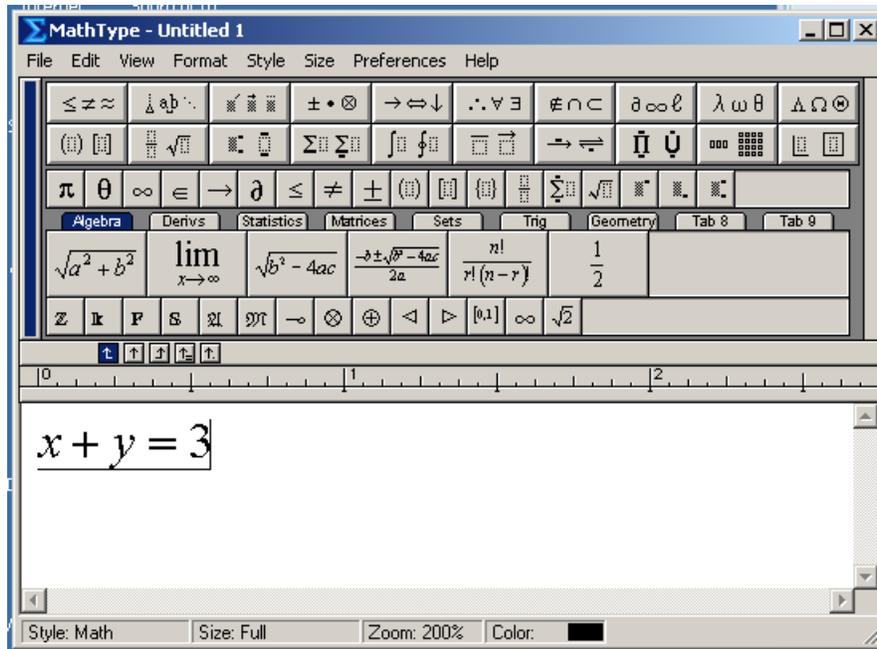

The Symbols part of the panel allows you to type Greek letters like α , β or mathematical symbols like \approx , ∞ , or \pm .

2. Since we want to create the system of equation on its own line, type some descriptive text (like in Step 1) and then left click Display.

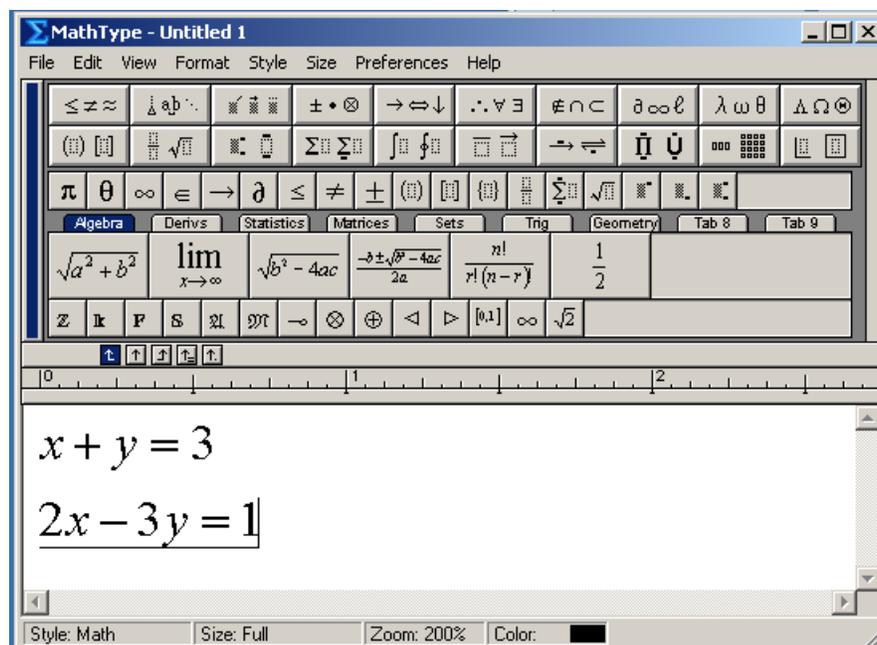

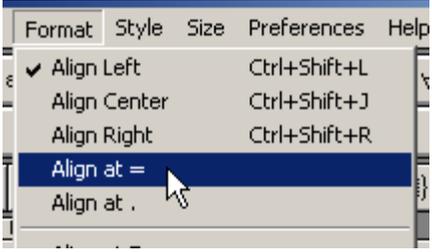

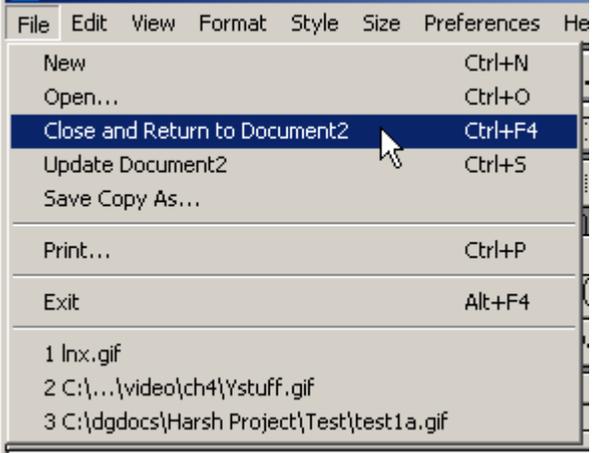

A Mathtype window like the one above will appear. This is the window we'll use to create equations, matrices and other mathematical creations.

3. Our system of equations is not too complicated and can be created using the buttons on the keyboard. More complicated expressions we'll require the use of the buttons you see in the top of the MathType window. Use your keyboard to type in the first equation of your system. The = is usually in the upper right hand corner of your keyboard.

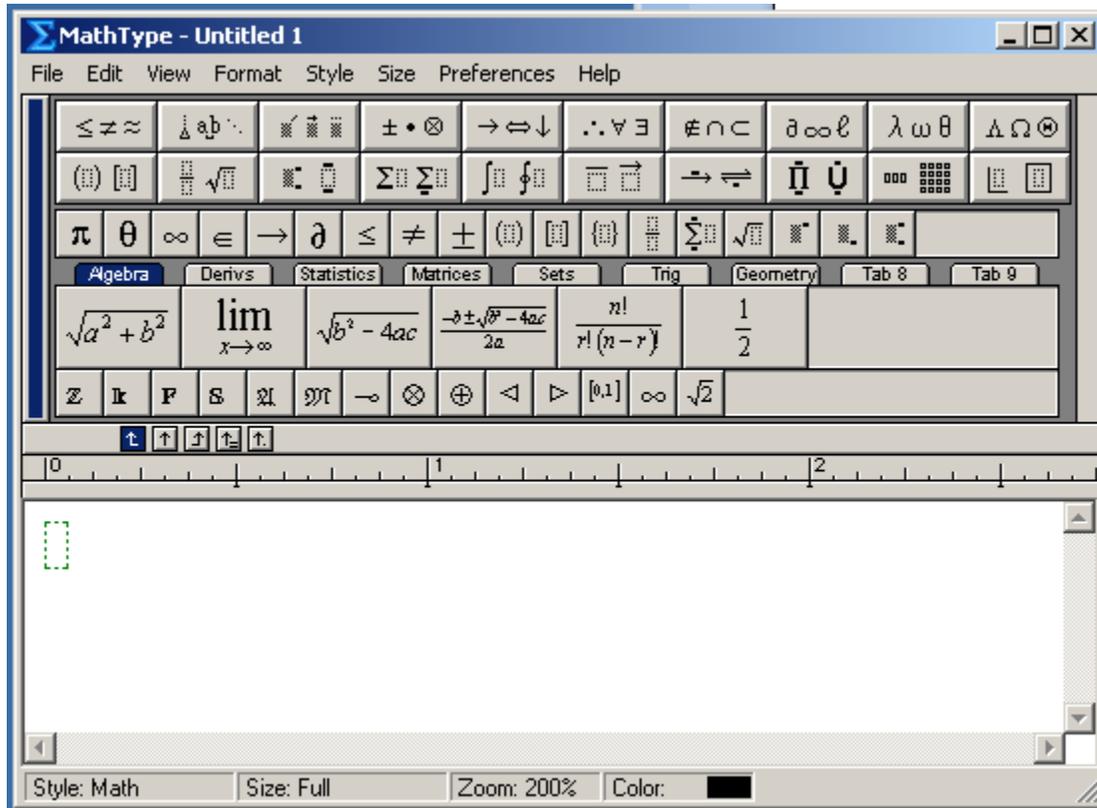

4. To start your second equation on a new line, press the Enter key on your keyboard.
5. Type the second equation in your system of equations.

<p>6. This system would look much nicer if the equations were aligned along the = sign. To do this, left click on the Format menu along the top of the window.</p> <p>7. Select Align at =. Notice that your equations line up along the = as desired.</p>	 <p>A screenshot of a software menu titled 'Format'. The menu items are: 'Align Left' (Ctrl+Shift+L), 'Align Center' (Ctrl+Shift+J), 'Align Right' (Ctrl+Shift+R), 'Align at =' (highlighted with a mouse cursor), and 'Align at .'.</p>
<p>8. The system of equations is complete. To paste this equation into your document, left click on the File menu along the top of the window.</p> <p>9. Select Close and Return to ???? where ???? is the name of your Word document.</p> <p>10. You should now see the system of equations on a separate line in your document.</p>	 <p>A screenshot of a software menu titled 'File'. The menu items are: 'New' (Ctrl+N), 'Open...' (Ctrl+O), 'Close and Return to Document2' (Ctrl+F4, highlighted with a mouse cursor), 'Update Document2' (Ctrl+S), 'Save Copy As...', 'Print...' (Ctrl+P), and 'Exit' (Alt+F4). At the bottom, there is a list of files: '1 Inx.gif', '2 C:\...\video\ch4\Ystuff.gif', and '3 C:\dgdocs\Harsh Project\Test\test1a.gif'.</p>

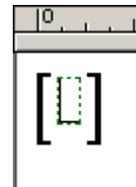

Create an Augmented Matrix with Mathtype

1. Start Word 2003 or 2007.
2. Along the top of Word 2007 you'll see a series of tabs. If Mathtype has been successfully installed, you'll see a Mathtype tab. Left click on the Mathtype tab. In Word 2003 you'll see a menu item called Mathtype. Click on the tab or menu item.
2. Type some descriptive text (like in Step 2) and then left click Display.

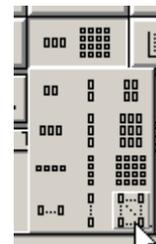

3. To start your matrix, create a set of brackets

by selecting  from the third row of buttons.

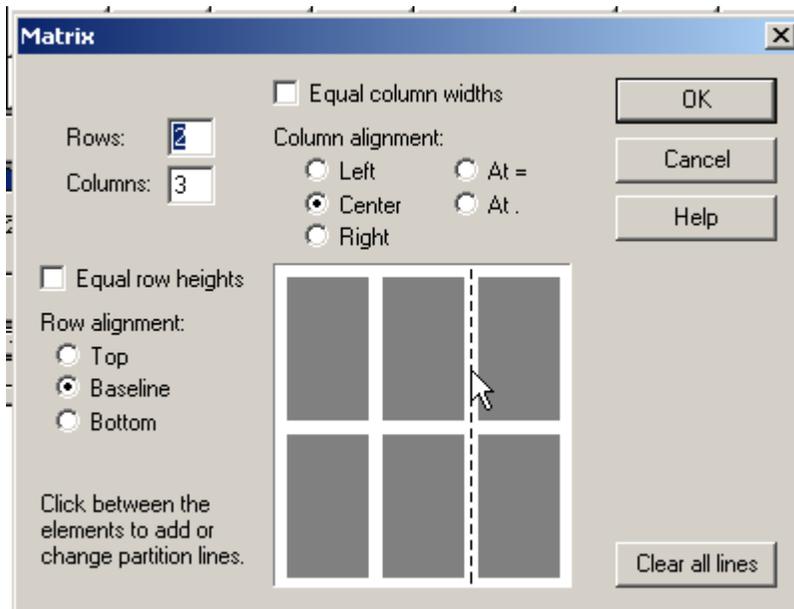

4. To create the matrix entries inside of the brackets, select  from the second row of buttons.

5. Select the lower right hand sub-button to create a variable sized matrix. Other buttons create matrices with specific sizes.

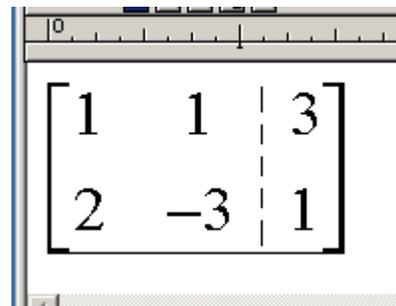

6. A box will appear that allows you to enter the number of rows and columns. Enter 2 for rows and 3 for columns as shown below.

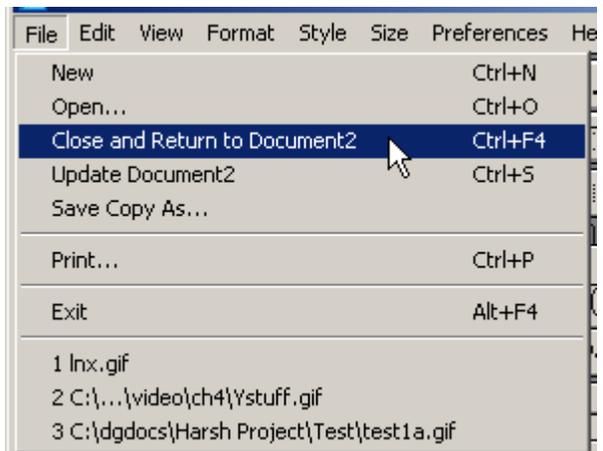

7. You can left click between the rows and columns to create solid lines or dashed lines between the rows or columns. Put a dashed or solid line between the second and third columns. You may have to click between the columns more than once to get the type of line you want.

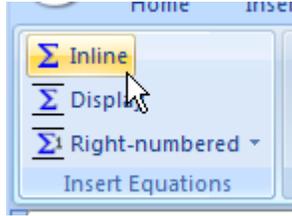

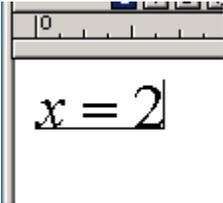

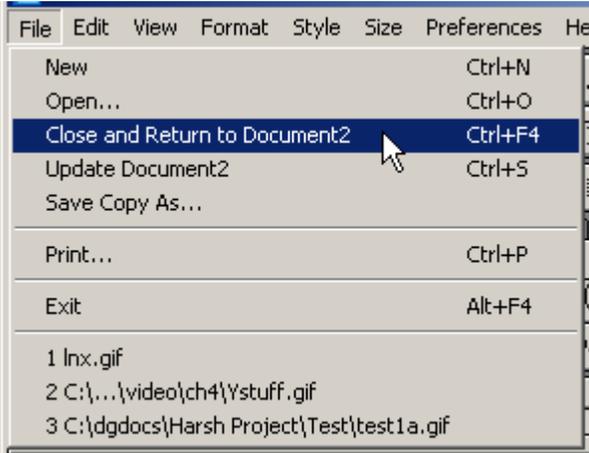

8. Enter the values for your augmented matrix by clicking your mouse in a space and typing the number.

9. The augmented matrix is complete. To paste this equation into your document, left click on the File menu along the top of the window.
10. Select Close and Return to ????, where ???? is the name of your Word document.
11. You should now see the augmented matrix on a separate line in your document.

Create an Equation within a Sentence with Mathtype

<p>3. Start Word 2003 or 2007.</p> <p>4. Along the top of Word 2007 you'll see a series of tabs. If Mathtype has been successfully installed, you'll see a Mathtype tab. Left click on the Mathtype tab. In Word 2003 you'll see a menu item called Mathtype. Click on the tab or menu item.</p> <p>5. To insert an equation within a line like in step 6, type some descriptive text. When you get to the point where you would like to insert your equation, left click on Inline.</p>	
<p>6. Use your keyboard to type the equation, $x = 2$.</p>	
<p>12. When the equation is complete, paste this equation into your document. Left click on the File menu along the top of the window.</p> <p>13. Select Close and Return to ???? where ???? is the name of your Word document.</p> <p>14. You should now see the equation within the sentence in your document.</p>	

Using the techniques outlined above, create a Word document and document the steps you used to solve your system of equations. Use the steps in the box above (steps 1 through 6) as a guide as to how your document should look.

Once you have documented your steps, save your document and turn it in using the link available online. Be sure to include your name, class and date in the document.

Document Your Steps in Word Using the Equation Editor in Word 2007 or 2010

We want to document the steps of solving the system of equations like is shown in the box below.

Step 1: Write down the system of equations.

$$\begin{aligned}x + y &= 3 \\ 2x - 3y &= 1\end{aligned}$$

Step 2: Write down the corresponding system of equations.

$$\begin{bmatrix} 1 & 1 & 3 \\ 2 & -3 & 1 \end{bmatrix}$$

Step 3: Multiply the first row by -2, add it to the second row and place the result in the second row or (-2 R1 + R2 > R2).

$$\begin{bmatrix} 1 & 1 & 3 \\ 0 & -5 & -5 \end{bmatrix}$$

Step 4: Multiply the second row by -1/5 and place the result in the second row (-1/5 R2 > R2).

$$\begin{bmatrix} 1 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix}$$

Step 5: Multiply the second row by -1, add the result to the first row and place the sum in the first row (-1R2 + R1 > R1).

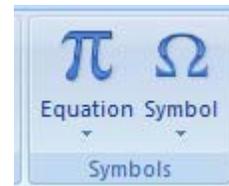

$$\begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 1 \end{bmatrix}$$

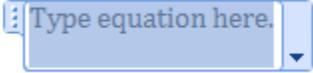

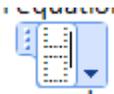

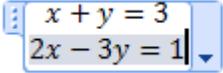

Step 6: Read the solution from the augmented matrix, $x = 2$ and $y = 1$.

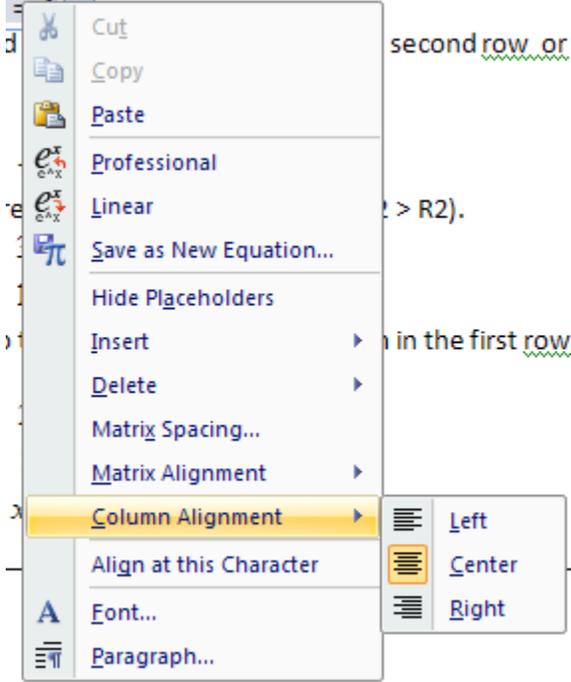

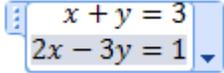

In the steps below, you'll learn how to enter a system of equations (as in step 1), an augmented matrix (as in steps 2 through 5) and an equation on a line (as in step 6).

Create a System of Equations with the Equation Editor in Word 2007 or 2010

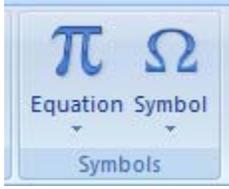

1. Start Word 2007 or 2010.
2. Click on the Insert tab. on the right hand side of the window is a panel containing the equation editor button titled Equation. This is the button we use to create equations, systems of equations, and matrices. The Symbol button is used to create individual symbols like π and α .

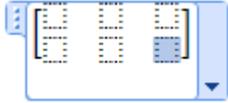

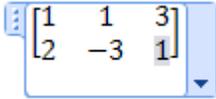

<p>3. Since we want to create the system of equation on its own line, type some descriptive text (like in Step 1) and then press Enter to place the insertion point on a line in the document.</p> <p>4. Press the Equation button to begin the system of equations.</p>	
<p>5. Our system of equations can be created using the Matrix button on the top of the window. To see this button, make sure you have clicked on the equation region.</p> <p>6. Press the Matrix button to reveal a submenu.</p>	
<p>7. From the Matrix submenu, locate the button indicating two rows and one column.</p>	
<p>8. Select the button with two rows and one column. This will insert two spaces in your equation where you may type the two equations.</p>	
<p>9. Select the first row by clicking the mouse in the space there. Type the equation in that space using the keyboard.</p> <p>10. Now click the mouse in the second row and type the equation for the second equation.</p>	

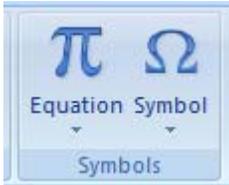

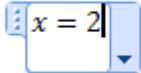

<p>11. These two equations are not aligned very nicely. Right click on one of the equations to reveal a menu.</p> <p>12. Towards the bottom of the menu is the option for column alignment. Select this option to reveal another submenu.</p> <p>13. Select Right alignment. For this set of equations, right alignment lines up the equal signs in the equation. Sometimes it is also necessary to add spaces to the equations to get the equal signs to line up.</p>	
<p>14. Your system of equation is now complete. You may click outside of the equation region to continue editing your non-equation content in the Word document.</p>	

Create an Augmented Matrix with the Equation Editor in Word 2007 or 2010

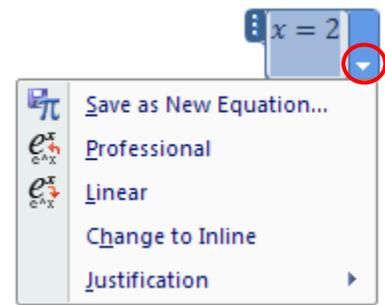

<p>1. Start Word 2007 or 2010.</p> <p>2. Click on the Insert tab. on the right hand side of the window is a panel containing the equation editor button titled Equation. This is the button we use to create equations, systems of equations, and matrices.</p> <p>3. Type some descriptive text (like in Step 2 through 5) and Enter on the keyboard. Then left click the Equation button.</p>	
<p>4. On the left side of the Word window is a bracket button.</p>	

<p>5. When you click on the bracket button, a submenu will appear. Click on the button shown to the right to insert the brackets in the matrix</p>	
<p>6. Click on the space inside the brackets to highlight that area.</p>	
<p>7. At the top of the Word window, locate the Matrix button. Select that button with the mouse.</p>	
<p>8. A submenu will appear. Select the matrix containing two rows and three columns.</p>	
<p>9. Click in each of the entries in the matrix and type the entry. 10. Your matrix is now complete. You may click outside of the equation region to continue editing your non-equation content in the Word document.</p>	

Create an Equation within a Sentence with the Equation Editor in Word 2007 or 2010

<p>1. Start Word 2007 or 2010.</p> <p>2. Click on the Insert tab. on the right hand side of the window is a panel containing the equation editor button titled Equation. This is the button we use to create equations, systems of equations, and matrices.</p> <p>3. Type some descriptive text (like in Step 6). When you need to insert an equation within a sentence, left click the Equation button.</p>	
<p>4. Use your keyboard to type the equation, $x = 2$.</p>	

5. Click the mouse outside the equation region and continue typing the sentence.
6. Sometimes Word will place an equation on its own line that you would like to be within a sentence. To change an equation that is displayed on its own line to an inline equation, click on the down arrow in the right corner of the equation region.
7. Select Change to Inline to place the equation within a sentence. An inline equation can be set on its own line following a similar procedure, but select Change to Display.

Using the techniques outlined above, create a Word document and document the steps you used to solve your system of equations. Use the steps in the box above (steps 1 through 6) as a guide as to how your document should look. Depending on what version of Word you are using, use Word 2003, 2007, or 2010.

Once you have documented your steps, save your document and turn it in using the link available online. Be sure to include your name, class and date in the document.
